DETAILED ACTION

Drawings

Figure 1 should be designated by a legend such as --Prior Art-- because only that which is old is illustrated. See MPEP § 608.02(g). A proposed drawing correction or corrected drawings are required in reply to the Office action to avoid abandonment of the application. The objection to the drawings will not be held in abeyance. See Applicant's specification page 5 lines 4 and 5.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

The changes made to 35 U.S.C. 102(e) by the American Inventors Protection Act of 1999 (AIPA) do not apply to the examination of this application as the application being examined was not (1) filed on or after November 29, 2000, or (2) voluntarily published under 35 U.S.C. 122(b). Therefore, this application is examined under 35 U.S.C. 102(e) prior to the amendment by the AIPA (pre-AIPA 35 U.S.C. 102(e)).

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later

invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

Claim 1 is rejected under 35 U.S.C. 102(e) as being anticipated by Stuntz et al. Stuntz et al. figure 2 discloses a control system for controlling a plant P (54) with feedback C (50) and feed-forward L (52) control systems having a demand signal W_d applied to both the feedback and the feed-forward control systems and both outputs summed together to generate the plant input where the feed-forward control function T_e has a first component which is a function of a model of the linear component of the plant characteristic and has a second component which is an adaptive function to compensate for the non-linear component of the plant characteristic as described in column 3 line 49 to column 4 line 35. While Stuntz et al. ignores the linear component of torque in his system as described in column 4 lines 19-34, that linear component does exist and it does satisfy the claim language for "a first component which is a function of a model of the linear component of plant characteristic." As for the adaptive function of the non-linear component which approaches the non-linear component of the plant characteristic, see Stuntz et al. column 5 line 14 to column 6 line 13, particularly column 5 lines 58-67.

Allowable Subject Matter

Claims 2-8 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

The following is a statement of reasons for the indication of allowable subject matter:
The prior art of record does not disclose or teach the non-linear component of the plant characteristic having the form as shown in the formula recited in claim 2. The prior art of record

also does not disclose or teach a control system as claimed for a permanent magnet linear motor as recited in claim 3. Stuntz et al. is concerned with eliminating disturbances to a combustion engine crankshaft while the instant invention is concerned with eliminating disturbances to a permanent magnet linear motor, which is why the non-linear components are different.
